Lingwood

Food Processing Machinery

The Problem :-

A major manufacturer of high quality ready meals was looking for a method of reducing staff costs on their meal assembly line. In addition they realised that they were giving away too much product in a number of key areas such as weight control going into the trays, lack of accuracy when filling, resulting in rejection and repacking of under weights and failing to maintain line speed in order to achieve maximum efficiency from their tray sealing equipment. Furthermore, they insisted that any solution proposed would need to be portable so that the savings identified could be made on a range of products which were processed across a number of different production lines within different areas of their factory.

The Solution :- Bilwinco portable Multihead weigher and filling tool

The Benefits :-

- High speed, accurate, proven multihead weighing technology keeps giveaways to a minimum
- Automated weighing and filling reduces the number of staff required on line
- Fully mobile design means the entire system can be moved from one area of the factory to another, ensuring complete flexibility to run the line exactly where you need it
- The weigher support frame has an automatic raising and lowering system so that access to the weigher for cleaning can be achieved without the need for a gantry, steps or ladders
- Bespoke tray filling tools to ensure accurate filling into the packaging of your choice, less spillage = more profit
- Fully waterproof construction to IP67 standard means the system is perfectly suited to the harsh wet environments of the food industry. Cleaning and hygiene need never be a problem again
- Integral reject facility automatically detects and removes under and over weight portions before they reach the tray. This ensures the product is not lost and can be re-used, packaging waste is reduced and your profits start increasing.
