

CASE STUDY

Ref: 9206

Lingwood

Food Processing Machinery

The Problem :-

Making the switch from manual drying of salads and vegetables to a more automated solution is a difficult decision for any business. Our customer had operated very successfully using manual basket centrifuges for many years. Their product quality was excellent and well received by their customers. They knew, however, that their line was not very efficient and labour costs were getting out of hand. Furthermore, the long production hours, combined with over loaded baskets and the tough wet environment was driving up maintenance costs. They were anxious to find a better solution

The Solution :- FE500 and FE800 Continuous in-line centrifuge

The Benefits :-

- Continuous operation ensures efficient line running
- Automatic in-line production removes all labour from the line thus delivering genuine cost savings
- Programmable control panel enables specific line set up for each product which in turn delivers consistent finished results
- Wide range of infeed and outfeed configurations means the line can be designed and built to utilise your factory floor space as efficiently as possible
- Control centrifuge fill by weight or volume to ensure against over loading and avoid unnecessary machine damage
- Can be supplied in conjunction with preparation, slicing, washing and packaging systems so that Lingwood can deliver a complete line solution.
- Flexible enough to handle a wide range of salads and vegetables
