

Plug and play

The GKS-Compac CP300 is a very compact vertical packaging machine suitable for packing various products. Being one of the smallest vertical form, fill and seal machines in the world, it can transform film into a bag by using a specially developed former set. Finally the machine fills and seals the bag. The machine is characterised by its flexibility and user friendliness. The GKS-Compac distinguishes itself from other packaging machines because it is fundamentally smaller and completely self-supportive – all it needs is a socket outlet with 230 volts. The pneumatic seal system is powered by the integrated air unit and if a higher capacity is needed, the machine can use external air. The GKS-Compac is suitable for packing all types of free-flowing food and non-food products in heat seal materials such as polypropylene, up to a speed of 30 bags per minute. Impulse materials such as polyethylene can be packed at a speed of 20 bags per minute.

The GKS-Compac offers the best bag-size/machine size ratio. Depending on the machine type, the GKS-Compac has a bag width of between 75 and 450mm; while the standard bag length is 500mm. The bag length is determined by an encoder or photocell on the film or a photocell on the product. The machine, which is operated manually, by hand or footswitch, is also prepared for producing block bottom and gusset-type bags.
